

SG750P 6.5 Creedmoor gas valve manual

- The gas valve includes four positions.
- The engraved numbers are the gas hole diameters in millimetres.
- The standard position is 1.2mm.
- A bigger diameter means faster bolt cycling speed and more forward ejection.
- The horizontal number, is the diameter in use.

For an optimal function, choose a valve position, that keeps the ejectet cases inside the green zone. Remember, every different ammunition type may affect the cycling speed.
